

REVIVE, Inc.

REVIVE GRANULES

REVIVE GRANULES are in a class by themselves because they provide organic fertilizers for plants not found in conventional chemical wetting agents combined with their ability to help water penetrate deep into soils.

WHAT MAKES THE REVIVE GRANULES UNIQUE?

The organic wetting agent properties contained within REVIVE are impregnated on 100% DPW (Dehydrated Poultry Waste) granules. The organic matter in the granule complements the chemical organic wetting agents in the formula to help soils accept and retain moisture. This reduces watering requirements and stress on lawns and turf areas throughout the year.

The DPW granule contains primary and secondary plant foods plus trace elements not found in conventional chemical wetting agents or fertilizers. These plant foods are much more effectively utilized by plants due to the chemical wetting and sequestering properties of Revive that allow them to penetrate deep into the root zone without being tied up in the soil, rendering them useless.

REVIVE GRANULES bridge the gap between wetting agents and fertilizers. It benefits both homeowners and commercial applicators to grow better, more healthy turf with less water and fertilizer.

REVIVE GRANULAR CONTENTS:

WETTING AGENT AND CHELATING PROPERTIES AS SHOWN ON THE LABEL. GRANULES - DPW (DEHYDRATED POULTRY WASTE)

FERTILIZER AMOUNTS:

N (Nitrogen)	6%	Fe (Iron)	2%
P (Phosphorus)	3%	S (Sulfur)	3%
K (Potash)	2%
